

# 'OZ' device

Zatikyan Olya

1 course

---

In most cases, we have to stand in huge queues in hospitals in order to learn the usual things about our body: the level of the iron, sugar and other substances.

We spend quite a lot of time and energy on this, maybe not even realizing it.

It is also difficult for the elderly people to get to the hospital, even though they just need to learn the usual things about his/her body.

Or also people who work hard. They are under a lot of stress, but they do not have time to visit the hospital to inquire about their health.

My device 'OZ' will easily help everyone to identify many things in his/her body in a few seconds.

You can determine which vitamins you are lacking, the level of sugar or iron, your pressure, temperature, whether you have any injuries by scanning your body and more. And all of these in one device.

And the last thing I would like to emphasize. This is how my invention will look like. It will be something like a mirror. It is very compact.

And there will also be an approximately similar and already invented device for measuring blood sugar level as a device for diabetics.

Thank you for your attention !!!
